ABSTRACT

A method and a therapeutic metered combined dose are disclosed for a combined administration of medicinal dry powders. A pre-metered medicinal dry powder combined dose comprising at least two medicaments of separate dry powder formulations is prepared, whereby the pre-metered powder quantity per medicament is deposited in to form the medicinal combined dose. The deposits of the medicaments are suitably kept separated from each other, such that the medicaments cannot detrimentally interact after forming of the combined dose, and the medicinal combined dose is introduced into an inhaler device for a delivery of the powder dose during the course of a single inhalation. In this single inhalation, the at least two medicaments of the medicinal combined dosage will generally be aerosolized simultaneously or sequentially such that a large proportion of each medicament will settle in the intended target area of the airways and lungs of a user.
